TITLE:

The Generalization of the Method of Quasisteady Conditions in the
Experimental Determination of Thermal Diffusivity Coefficients

PERIODICAL:

Inzhenerno-fizicheskiy zhurnal. 1960. Vol 3 No. 1 pp 76 - 81

TEXT: In the present paper the endeavor is made to simplify the method of determining the thermal diffusivity coefficient by generalizing the solution of the given non-steady heat conductivity for the case of a variable specific heat of heating until an arbitrary certain temperature at a certain point of the body. Proceeding from the measurement of the time interval from the beginning of heating of a body of simple shape by means of a constant heat current at the heating of a body of simple shape by means of a constant heat current at $r = r_1$ (curve 1) and $r = r_2$ (curve 2). The found dependence of α and two extreme cases are mentioned (Fig. 2). Experiments were made with samples of steel of the type IX18N9T. For measuring the thermoelectromotive force of the thermo couples the galvanometer GZP-47 with the potentiometer PV 6 was used. The dependence of the thermal diffusivity coefficient α of the steel of the

TITLE: Method of recording and reading information from a fine anisotropic ferromagnetic film. Class 21, No. 184936 [announced by Moscow Order of Lenin Aviation Institute imeni S. Ordzhonikidze (Moskovskiy ordena Lenina aviationsionnyy institut)]

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 16, 1966, 55

TOPIC TAGS: information storage, data recording, data readout, magnetic field

ABSTRACT: A method of recording and reading out of information from fine anisotropic ferromagnetic films is proposed. Recording is accomplished by a field acting along the mean easy axis of magnetization and reading by a field acting along the mean hard axis of magnetization. To store analog information, the value of the field which acts along the mean hard axis must exceed the value

Card 1/2

UDC: 681.142.07

L 45833-66

ACC NR: AP6030574

of the anisotropy field. The recording field value which corresponds to the stored analog information lies within the region of boundary creep and shift, while the value of the reading field lies within the region of nondestructive readout.

TITLE: The gradients of the integral electron content in the ionosphere^{1/2} B

SOURCE: Geomagnetism i aeronomiya, v. 4, no. 6, 1984, 1124-1125

TOPIC TAGS: Ionosphere, coherent frequency, geometrical optics, ionization gradient, satellite velocity, Kosmos-11 satellite, electron distribution

ABSTRACT: The integral electron content in the ionosphere between the emitter and the receiving point is connected with the phase difference of the coherent frequencies. The behavior of the known gradient of the integral electron concentration along the orbit of an artificial earth satellite makes it possible to determine the changes in the entire ionosphere below the satellite from day to day as well as at different times of the day. The data produced by 44 different observations of the Kosmos-11 artificial earth satellite have been processed by the authors. The satellite was equipped with a Mayak transmitter which emitted coherent frequencies of 20.005 and 40.015 megacycles. There were considerable differences in the structure of the ionosphere, below the satellite, during its "daytime" and "night" flights. "The author" express their gratitude to Ya. L. Al'pert for his

TITLE: Belt grinding machine. Class 67, No. 168604

SOURCE: Byulleten' izobretensii i tovarnykh znakov, no. 4, 1965, 108

TOPIC/TAGS: grinding machine

ABSTRACT: This Author's Certificate presents a belt-grinding machine for machining, e.g., the shape of compressor and turbine blades. The spindle of the product is placed in a rocker and rotates relative to a wide abrasive belt which passes around a master form fed onto a notch. To increase the efficiency and accuracy of machining a blade stylus, the spindle of the product is coupled with the connecting rod of a hinged four-way joint provided with a pin driving one end of the rocker. The other end of the rocker is hinged to the frame for communicating to the spindle nonuniform rotation about its axis (see Fig. 1 on the Enclosure). This insures the machining of the stylus shape on the larger portion of the master form and the machining of the shoulder on the correspondingly smaller part of the master form. TOPIC TAGS: artificial earth satellite, geophysical rocket, Kosmos 11, Elektron 1, Doppler effect, Faraday effect, ionosphere, ionosphere profile, electron concentration

ABSTRACT: Results are presented of radiophysical observations of the outer ionosphere by means of the Kosmos-11 and Elektron-1 artificial earth satellites and geophysical rockets. Two methods were used for this purpose: the Doppler frequency shift at coherent frequencies and the rotational Doppler effect (Faraday effect) at fixed frequencies, simultaneously at one or several points. The Kosmos-11 and Elektron-1 observations yielded the value of the local electron concentration along the satellite orbit with satisfactory accuracy. From these, a profile of the ionosphere up to 2000 km was plotted. The histograms of ionospheric inhomogeneity layers were

TITLE: Measurement of electron concentration in the upper ionosphere by Kosmos satellites

SOURCE: Kosmicheskiye issledovaniya, v. 3, no. 4, 1965, 595-603

TOPIC TAGS: upper atmosphere, electron density, satellite/Kosmos satellite

ABSTRACT: The electron concentration in the upper ionosphere was measured in October 1962 by determining the phase difference of two coherent signals transmitted from Kosmos II on 20.005 and 90.0225 Mc and received by stations at two different locations in the USSR. Data from 46 observation periods were collected and graphs were plotted of the local electron concentration as a function of time along the satellite path. It was found that local electron concentration N_B increased by a factor of 3-4 at the same altitude during passage of the satellite from night to day. For several consecutive days, N_B values repeated themselves within a 20% deviation. Pinching of the upper ionosphere was noted during the transition from maximum to minimum solar activity. Analysis of spectra of ionospheric inhomogeneities showed

TITLE: Electron concentration in the upper ionosphere, measured by observing coherent signals from the Kosmos and Elektron satellites

SOURCE: Geomagnetizm i aeronomiya, v. 6, no. 5, 1966, 852-857

TOPIC TAGS: ionospheric electron density, satellite data analysis

ABSTRACT: Radio signals from the Kosmos-11, Elektron-1, and Elektron-3 satellites have been used to calculate the electron density of the upper ionosphere. The calculation method is that used in earlier Kosmos studies, which is based on measuring the relative Doppler shift between two rf signals simultaneously received from the satellite. The following frequencies were used: Kosmos-11, 20.0048 and 90.0216 mc; Elektron-1, 20.005 and 30.0075 mc; and Elektron-3, 20.005, 30.007, and 90.022 mc. Receiving stations were widely enough separated to permit simultaneous recording of signals at high elevation and near-horizon line-of-sight angles, and thereby measure the effect of different transmission paths through the ionosphere. The electron density profiles with altitude were determined independently at each receiving station, and agreed tolerably well. A comparison of daily and seasonal concentration profile variation is given in the figure; all three curves corresponded.

to periods of low or minimum solar activity. The authors speculate on the nature of the pronounced dip in the profile, noted in the 400—500 km altitude region. They suggest that their data may indicate the existence of a previously unidentified additional ionospheric layer above the F2 layer which varies either sporadically or regularly. ABSTRACT: The authors investigated the properties of the FMK-11 friction pair steel--powdered metal. The faults of this pair are revealed: They consist of a decrease in the friction coefficient after a long break in operation. The causes of the instability of the friction properties of the pair are ascertained. The technology of manufacturing sintered elements for automatic coupling is described and conclusions are drawn as to the advantages of this friction material for use in shock absorbers.

TOPIC TAGS: polymer, copolymerization, graft copolymer, radiation polymerization, imide, maleic acid			
ABSTRACT: This Author Certificate presents a method for obtaining graft copolymers on the basis of poly-organosiloxanes by the interaction of ionizing radiation with a polyorganosiloxane powder in the presence of modifying additives. To improve the physicochemical properties of the graft copolymers and their thermal stability and solvent stability, imides, e.g., N-substituted imides of maleic acid, are used as modifying additives. The radiation dosage is 0.3--8 Mrad and the intensity of radiation is 0.05--0.7 Mrad per hour.

Priborostroyeniye, 1958, Nr 6, pp. 19-21 (USSR)

ABSTRACT:

The expression "pressure scheme" is used for a radio-electronic device which is mounted on a pressure plate (the base plate is made from insulating material) in form of a "pressure assembly" (a system of current-carrying "pressure wires"). The "pressure schemes" are, seen in the light of automatization, a great improvement. By using them it is possible, also when constructing radio-electronic apparatus, to accelerate work considerably. The possibilities of mounting the amplifiers U E-109, UE -209 and their varieties upon the "pressure plates" are then described. Hard rubber plates (thickness 1-1.5 mm) are used as "pressure plates"; thin copper foils of from 0.03 to 0.05 mm thickness are applied onto them. By a special method of etching the guide for the wiring line is etched into these pressure plates. The amplifier described, the basic wiring circuit of which is given, has a sensitivity of 1 - 2 μ V; the noise level is about 1.5 - 3 V.

Card 1/2

The Electron Amplifier of a Potentiometer for
a "Pressure Scheme"

119-58-6-5/13

A comparison between the hitherto used method of mounting and
"pressure mounting" shows that, with respect to the aforementioned
amplifier, the working capacity can be reduced by 50%, prime costs
by 10% and manual labor by 50%. There are 4 figures.

Title : Corn on Saline Soils.

Orig Pub : Tr. Omskogo s.-ki. in-ta, 1954, 22, No 1, 111-116

Abstract : In the saline regions of Siberia, corn should be planted on soils with a humus horizon of not less than 18 centimeters. For the depth of 15-18 centimeters, application of not less than 30 tons per hectare of humus or manure over the entire massif and into the pockets is necessary.

Soils of the Forest Steppe Zone of Western Siberia.

Orig Pub: Tr. Tomsk. un-ta, 1957, 140, 120-127.

Abstract: Heavy and average solonetz of Western Siberia can
be assimilated into the field crop rotation sys-
tem and highly basaltic and subrose types into
fodder crop rotation. Deep plowing without a
blade grader is a promising method of solonetz
cultivation which deserves study in a broad pro-
ductive test. Best results of solonetz assimil-
ation under grain crops is obtained by the combin-
ed application of organic and mineral fertilizers

TITLE: Use of Hammer Mills for Crushing Limestone. (Primeneniye molotkovykh drobilok dlya izmel'cheniya izvestnyaka)

PERIODICAL: Metallurg, 1957, Nr 7, pp.5 - 6 (USSR)

ABSTRACT: Dissatisfied with the performance of the Gipromez-designed rod mills installed at the Cherepovets works for grinding limestone for use in self-fluxing sinter production, the authors proposed that hammer mills should be used instead. For this the type CM-19A hammer mill previously used for preliminary crushing of limestone was reconstructed by the works into type CM-19A-P, giving a finer product. The article gives a general outline of the modifications and tabulations of operating and cost data for the reconstructed mill, a larger hammer mill and the rod mill. The respective productivities are 25.40 and 12 tons/hr, the energy consumptions 4.6, 9.2 and 12.9 KWh/ton, costs 37.2, 156.3 and 165.3 thousand roubles, weights 6.5, 15.5 and 55.0 tons. From the same size-graded feed the reconstructed hammer mill gave 4.48 and 95.52% of 5-3 and -3 mm fractions, respectively, the

Card 1/2

Assimilation of technology and new practice in the mining plant of the Cherepovets works. N. M. Vakhnina and L. R. Mirkutukil (Polytech. Inst. Leningrad and Met. Plant, Cherepovets). Sov. TV, 202-000 (1987). The plant operates on 80% Fe concentrate carrying SiO₂ 14 and CaO 1.0%; the sintering basicity is 0.43-1.1. Individual features of the sintering practice are examined. Increasing basicity of the sinter does not lower its number strength though its storage characteristics are reduced, particularly when hematite particles larger than 2 mm are present. With 15-20% of limestone particles, sinter is determined in one day; with 1.5% it was sintered after 7 days. Adding limestone increased both the total production of the sintering plant and the sintered concentrate. Sintered concentrate

TITLE: Study and application of the bioclimatological characteristics of agricultural crops [Paper presented at the Agrometeorological Conference held in Kecskemet, Hungary from 15 to 19 September 1964]

SOURCE: Idojaras, v. 69, no. 1, 1965, 13-26

TOPIC TAGS: agriculture crop, agriculture science, climatology

ABSTRACT:

Investigations were carried out in Rumania on the following crops: Indian corn, sunflower, wheat, potatoes, and grapes. This paper represents an account of the results of a study conducted on various types of sunflower and Indian corn, seeded at different times, and deals with the effects of current weather conditions on the lengths of phenological phases, date of leaf appearance, stem length and thickness, and length of vegetation period. The findings were utilized to characterize the agrometeorological conditions involved. Orig. art. has: 10 figures and 9 tables. JPRS

The deficiency of riboflavin and thiamine in the pellagra patient is often considered to be the cause of the disease. In the "Revista de Sanitățe Publică" 1954, No. 4, 757-8 (1954) it is however presented that the pellagrous persons are afflicted with it because of a deficiency of riboflavin in their diet. But the riboflavin deficiency does not constitute a steady character of the pellagrous patient's nutrition as in the case of the nicotinamide deficiency (cf. *Bul. Stint. Acad. R.P.R. Série: Sănătate Medicale*, 2, 1229 (1950)). From the time of the appearance of the erythema, the nutrition improves considerably concerning the riboflavin and a no. of pellagrous patients respond in a satisfactory manner (about 25%) to the guan. test. On the other hand data concerning the thiamine in nutrition are concordant and demonstrative. They also show that the needs of the pellagrous patients to thiamine are generally satisfied. There are no reasons which would justify the classification of pellagra in a special category of deficiency ailment.

"Formation of Antibodies in Rats Receiving Injections of Vitamin K3 and
Exposed to X-Irradiation"

Bucharest, Revista Sanitara Militara, Vol 16, Special No., 1965; pp 474-481

Abstract: Preliminary study on rats administered unstated dose of vitamin K3 15 minutes before irradiation with 250 r showed that mortality was 55% in comparison with 19% in irradiated rats not having received the vitamin. However, in a later more comprehensive study results on the effect of K3 on mortality and immunogenicity in irradiated rats were relatively uncertain despite statistical treatment. 4 tables, graph.

"Effect of Administration of Immune Homologous Antitissular Serum in Irradiated Mice"

Bucharest, Revista Sanitara Militara, Vol 16, Special No., 1965; pp 481-487

Abstract: In mice, injection of homologous immune sera of spleen or liver homologous tissue antibodies, all tended to exert a protective effect on subsequent radiation as to onset*and total mortality. 3 tables, 2 graphs.

"Experimental Infections in Rats Receiving Injections of Vitamin K3 and
Exposed to X-Irradiation"

Bucharest, Revista Sanitara Militara, Vol 16, Special No., 1965; pp 490-491

Abstract: In rats administered 100 mg/Kg of vitamin K3, irradiated with
250 r, and inoculated with *Salmonella typhi*. Mortality seemed about the
same in all groups, i.e., vitamin K3 did not increase either susceptibil-
ity to mortality from radiation or to virulence of the *Salmonella*.

AUTHOR: Mihai, A. (Pharmacist, Lieutenant)

TITLE: Contributions to the determination of the qualities of some vegetable
and pharmaceutical products with chamazulene

SOURCE: Revista Sanitara Militara, no. 5, 1964, 845-850

TOPIC TAGS: chromatographic analysis, hydrocarbon, drug

ABSTRACT: The author adapted known chromatographic methods
for the qualitative and quantitative determination of cham-
azulene in several vegetable products (Flores Millefolii,
Flores Chamomillae and Herba Absinthi); the prochamazulene in
Tinctura Amara; and the Chamazulene contents in extracts of
various Rumanian pharmaceutical products. Orig. Art. Incl.: 3 tables,
18 references.
